Hello -

We have just completed a revised version of a paper that covers computational characteristics of different language models under different conditions, shedding light on a topic that is not very well understood in the research literature, covering a wide range of topics in the field of AI and NLP, as well as computational linguistics, language representation and semantic spaces. While the work is longer than the typical computer science article it covers a lot of ground and is important for the research community in these fields for the reason described - we would like to have it published in this form.

I, the primary author, Peter Worth, am a PhD candidate in the department of Computer Science at FAU where I am finalizing my research work for my dissertation. I am a well published researcher in the area of language models, artificial intelligence and computational linguistics (https://scholar.google.com/citations?user=NMerz5sAAAAJ&hl=en). My co-author, Dr Ionut Cardei (my advisor) is a full Professor in the Computer Science Department at FAU and is himself a very reputable and well published researcher in the area of network & systems engineering. We are working together on studying the performance of language models in a variety of computational contexts, and also starting a lab where the same knowledge can be applied to Cyber Security where I have spent the majority of my professional career (https://www.linkedin.com/in/pjwathena/).

We appreciate the consideration for this piece, we feel it is groundbreaking in the area it covers and is a meaningful contribution to the research community as it stands.

Thank you

Peter
